

Cool Git Tricks

(That I learn when things go badly.)

Carina C. Zona

@cczona

www.cczona.com

I write a detailed
commit message.

(About some other changeset.)

```
$ git commit
```

```
# Changes to be committed:
```

```
#...
```

```
# modified:   foo.txt
```

```
$ git commit -v
```

```
# Changes to be committed:
```

```
#...
```

```
# modified:   foo.txt
```

```
#...
```

```
-old line
```

```
+new line
```

I create long branch
names.

(Then have to type all that.)

git/contrib/completion/
git-completion.bash

```
cp git-completion.bash ~/.git-completion.sh
```

```
echo source ~/.git-completion.sh >> ~/.bashrc
```

```
$ git checkout <tab><tab>
```

0.1-mvp-release

2.0-public-release

authentication-basic

button-to-pay-me

live-customer-chat

marketing-content-dump

master

optimize-for-webkit

redesign-for-fall-2012

ui-performance-enhance

```
$ git checkout b<tab>
```

```
Switched to branch 'button-to-pay-me'
```

I use 'git status'

(A lot.)

git/contrib/completion/
git-prompt.sh

```
cp git-prompt.sh ~/.git-prompt.sh
```

```
echo source ~/.git-completion.sh >> ~/.bashrc
```

#master |MERGE \$

#master |REBASE-i \$

#master + \$ # tracked

#master \$ \$ # stash

#master> \$ # upstream

3 pending on foundation#master

```
~/repo/foundation/css $ git add .
```

3 pending on foundation#master

```
~/repo/foundation/css $ git commit
```

...

0 pending on foundation#master

```
~/repo/foundation/css $ touch new.txt
```

1 pending on foundation#master

```
~/repo/foundation/css $
```

I pathologically avoid
``git add .``

(Now.)

```
$ git grep -e stupid \  
    --and -e boss
```

```
index.html: The boss is a stupidhead
```

```
$ git grep -e promotion \  
  --or -e bargain \  
  --not -e (coupon|discount)
```

```
# working area tracked
```

```
$ git grep
```

```
# working area tracked & untracked
```

```
$ git grep --untracked
```

```
# working area all (ignore .gitignore)
```

```
$ git grep --untracked --no-exclude-standard
```

```
# staged
```

```
$ git grep --cached
```

```
# arbitrary commit
```

```
$ git grep "2007" HEAD^
```

```
# range
```

```
$ git grep "2007" c0c1e80..141a16a
```

```
# every commit
```

```
$ git grep "2007" $(git rev-list --all)
```

I don't necessarily
detect a problem
immediately.

(Time machine needed.)

```
$ git bisect start  
$ git bisect bad HEAD  
$ git bisect good v2.0
```

Bisecting: 44 revisions
left to test after this
(roughly 6 steps)

...

b047b0 is first bad commit

I sometimes need to
pretend a commit
never happened.

(Like, even rebase ain't gonna cut it.)

```
$ git checkout HEAD~10
```

```
...
```

```
$ ls
```

```
about.html
```

```
contact.html
```

```
uber-secret-never-commit-this.txt
```

(leaving out many crucial details...)

`filter-branch` # remove from local
commits...

`reflog expire` # make artifacts
eligible for garbage collection

`gc` # do the garbage collection

`push --force` # rewrite remote
history

Git can be a pain.

It also has cool tricks to take pain away.

(Whew.)

Questions?
